

CUSTOMER SUPPORT REFERENCE

AXpress Support Guide

A plain-language product overview for support agents — how AXpress works, how orders move, how to answer common merchant/rider questions, and what not to promise.

Audience: Customer Support / Live Chat / WhatsApp Bot Escalation Team

16 Glossary

1. What is AXpress?

AXpress (Assured Express) is a delivery platform for merchants in Lagos. A merchant signs up, funds a wallet or picks a plan, and books a delivery — AXpress finds a rider, moves the package, and keeps everyone updated along the way.

Think of it as three things working together:

- **A merchant app/website** — where businesses create and pay for deliveries.
- **A fleet of riders** — who pick up orders offered to them in their zone and deliver them.
- **An operations team** — dispatchers and zone leads who step in when something needs a human (no rider available, a stuck order, a pricing question).

As support, you sit between all three — merchants and riders come to you when something in this chain doesn't work as expected.

2. Who's Who

Role	What they do	Where they work
Merchant	The business booking deliveries. Funds a wallet or subscribes to a plan, creates orders, tracks them.	Merchant web portal
Rider	Picks up and delivers packages. Sees available orders in their zone and accepts them.	Rider mobile app
Customer / Receiver	The person receiving the package. Sometimes pays on delivery ("receiver pays").	No app — gets WhatsApp/email updates only
Dispatcher / Ops staff	Monitors live orders and riders, manually assigns a rider when needed, resolves exceptions.	Operations portal
Zone Captain / Vertical Lead	Oversees a geographic zone or business group's performance and targets.	Operations dashboards

Every one of these (except the plain Customer) has a single AXpress account, so a merchant and a rider are really the same type of underlying record with different "hats" — you don't need to worry about that technically, just know that *merchant support* and *rider support* are different playbooks even though they're "the same system."

3. How an Order Moves

Every order moves through a status. Here's what each one means in plain English:

Pending	Order created, waiting for a rider to accept it (or a dispatcher to assign one).
Assigned	A rider has taken the job.
Accepted	The rider has confirmed they're doing this delivery.
Started	The rider is on their way to the pickup point.
Pickup	The rider has collected the package.
Fulfilling	The rider is en route to the drop-off.
Arrived	The rider has reached the delivery address.
Done	Delivered successfully. This is the finish line.

Orders can also end in one of three ways instead of "Done":

- **Cancelled by merchant** — the merchant called it off (only possible before pickup — see §14).
- **Cancelled by rider** — the rider backed out.
- **Failed** — the delivery attempt didn't succeed (used manually by ops, not automatic).

If a merchant asks "what does [status] mean," this table is your source of truth — read it back to them in plain terms rather than the raw status word.

4. Types of Deliveries

Type	What it is
Quick Send	One pickup, one drop-off. The simplest, most common order.
Multi-Drop	One pickup, several drop-offs in a single trip — for merchants sending multiple packages to different customers at once.
Bulk Import	Same as Multi-Drop, but the list of stops is uploaded (e.g. from a spreadsheet) instead of typed in one by one — for merchants with a lot of stops.
Grouped	A variant of Quick Send that operations can later merge together into one Multi-Drop trip for efficiency. From the merchant's side it looks and behaves like a normal Quick Send order.

5. How Merchants Pay

Payment method	In plain terms
Wallet	Merchant pays upfront from their AXpress wallet balance. Money is held ("escrowed") until the delivery completes, then released. If the order is cancelled before pickup, this is refunded to the wallet automatically.
Cash	Merchant/sender pays the rider cash at pickup.
Cash on pickup	Same idea as Cash — money changes hands at the pickup point.
Receiver pays	The person receiving the package pays the rider on delivery, on the merchant's behalf.
Postpaid	Merchant doesn't pay per order — costs build up and are billed together later. See §7.
Subscription	Merchant is on a plan; the order is covered by their plan's free-order allowance or credit. See §7.

6. Wallet & Funding

Merchants can fund their wallet two ways:

A. Card or bank payment (Paystack)

Merchant pays through Paystack in the app. Minimum top-up is ₦100. The wallet is credited automatically once the payment is confirmed.

B. Bank transfer (dedicated virtual account)

Every merchant gets their own personal bank account number (via our banking partner). They transfer money to it like a normal bank transfer, and it lands in their AXpress wallet.

"My wallet didn't update" — how to triage

1. **Ask which method they used** — card/Paystack, or bank transfer to their virtual account.
2. **If Paystack:** ask for the payment reference/receipt. If the payment definitely left their card/bank but the wallet is still short, this usually means the confirmation step didn't complete (e.g. they closed the app before it finished). This is fixable — escalate with the reference number for manual reconciliation rather than telling the merchant to "just try again," which could double-charge them.
3. **If bank transfer:** these only credit once our banking partner sends us a confirmation. If that confirmation hasn't arrived, the credit will look "stuck" from the merchant's side. Escalate with the transfer amount, time, and sending bank so engineering can check whether we received confirmation for it.
4. There is no funding fee on either method — if a merchant says less arrived than they sent, that's unexpected and should be escalated, not explained away as a fee.

7. Subscriptions vs Postpaid

Subscription plans

A merchant pays a monthly fee and gets a set number of free orders per month, plus sometimes a credit pool. Once the free orders are used up, extra orders cost a flat "overage fee" each.

"Why was I charged extra this month?" — Subscription orders always show as ~~¥0~~ at the moment they're placed, but once the free-order allowance runs out, each additional order quietly adds an overage fee. All of it — the plan price plus any overage fees — is billed together in one invoice at the end of the 30-day cycle. That invoice is what the merchant is seeing.

"Why does my order always go to the same rider?" — Some plans include a dedicated rider. If a merchant is on one of those plans, their orders are offered to that specific rider first before going to the general pool.

Postpaid

No free orders or credits — every order's full cost is simply added to a running tab. That tab is invoiced weekly or monthly, with a 24-hour window to pay it. If it's not paid in time, the merchant's account is temporarily blocked from placing new postpaid orders until it's settled.

A merchant is on **either** a subscription plan **or** postpaid billing — never both at once.

8. Getting a Rider

When an order is created, it's offered to every available rider in the pickup area's zone at the same time — whoever accepts first gets the job (unless the merchant has a dedicated rider, who gets first refusal).

"No rider found" / order stuck in Pending: there is currently no automatic timeout or escalation if no rider accepts an order — it will simply stay visible to riders in that zone indefinitely. If a merchant reports an order sitting unassigned for a while, this needs a **human dispatcher** to manually assign a rider from the operations dashboard — it will not resolve itself. Escalate promptly rather than asking the merchant to "wait a bit longer."

9. Tracking a Delivery

What you (and the merchant) can actually see for an order today:

- Current status (see §3's plain-English stages)
- Assigned rider's name (or "not yet assigned")
- Pickup and drop-off addresses
- Timestamps for when it was assigned, picked up, arrived, and completed

There is **no live GPS map or ETA** shown to merchants or customers at this time — don't tell a merchant "you can watch your rider move on the map," because that feature isn't available to them yet. Give status + timestamps instead.

Separately, deliveries made through a SmartParcel locker have their own tracking number lookup, independent of a normal order.

10. Ratings & Complaints

Rider ratings are not currently working. The feature exists in the product, but ratings aren't being captured in practice — every rider shows a 0 rating regardless of real performance. If a merchant asks to rate a rider, don't imply it feeds into anything visible right now.

There's no formal complaint/dispute ticket system — complaints are handled by support directly (you), or escalated to the operations team. Log the issue in whatever your support/ticketing tool is; there's no in-product "dispute" object to point a merchant to.

11. WhatsApp Ordering

Merchants can do a limited set of things directly over WhatsApp, without opening the app:

- Sign up as a new merchant
- Get a delivery price quote (send pickup + drop-off address)
- Create a Quick Send order (this debits their wallet immediately — it will be rejected if their wallet balance is too low)
- List their recent orders, view one order's details, cancel an order (refunds to wallet like the app does)
- Check wallet balance, view recent transactions, get their virtual account number for a bank transfer top-up

Orders placed via WhatsApp are known to sometimes not label themselves quite the same way as app orders internally — if a merchant says a WhatsApp order isn't showing up correctly in their app order list, this is a known rough edge worth flagging to engineering with the order number rather than assuming user error.

Separately from the ordering bot, merchants also receive automatic WhatsApp *notifications* (order created, rider assigned, picked up, delivered, cancelled) — that's a one-way messaging feature, not the same as the two-way ordering bot above.

12. AI Support Chat

The in-app chat is an AI assistant, split into two specialists behind the scenes:

- **Order support** — can look up an order by number and explain its status and delivery details. It's instructed never to promise a specific delivery time.
- **Technical support** — helps with app glitches, login issues, and general "it's not working" problems with basic troubleshooting steps (e.g. restart the app, clear cache). It can't look anything up — it's conversation-only.

The AI can flag a conversation as needing a human, but if the AI itself is down, users see this exact fallback message: *"Our Virtual Agent is currently not available, a human will reach out in a please be patient, as we have notified our team."* — if a merchant quotes that message to you, it means the AI was offline and they're waiting on a human (you) to actually follow up, since there's no confirmed automatic alert that always reaches a person.

13. Notifications

Channel	What it's used for
WhatsApp	Order created, assigned, picked up, delivered, cancelled; referral payouts; weekly reports.
Email	An email at every order status change; dispatcher alerts on new orders; marketing/drip campaigns.
Push notification (app)	Riders get pushed new job offers/assignments; merchants get pushed key events like "Rider Assigned" — only works if they have notifications enabled on their device.
SMS	Not currently supported. Don't tell anyone to expect an SMS.

14. Common Questions — Quick Answers

Q: Can a merchant cancel an order after it's been picked up?

A: No. Cancellation is only possible before the rider has picked up the package. Once picked up, it has to be completed, failed, or handled by a dispatcher.

Q: If a wallet order is cancelled, does the merchant get their money back?

A: Yes, automatically and in full — there's no cancellation fee.

Q: Why does a Multi-Drop or Bulk order sometimes cost less than expected for a long-distance leg?

A: There's a price cap: no single delivery leg on a Multi-Drop or Bulk order can be charged more than ₦20,000, even if the raw calculation would be higher. This is expected behavior, not a pricing error.

Q: A merchant says the dashboard shows them as "inactive" even though they order regularly — what do I say?

A: This has been a known data issue historically (the inactive flag wasn't always based on real recent orders). If you see it, note the merchant account and escalate rather than telling them it's accurate — it may well be a display bug rather than a true account status.

Q: Why is a dispatcher-created order's price a bit unusual compared to normal orders?

A: Orders placed manually by a dispatcher (rather than through the merchant app) sometimes don't have full route-distance data behind them, so the price basis can look different. This is a known limitation, not necessarily an error.

Q: A merchant is asking for a refund for a "Failed" delivery — is that automatic?

A: No — unlike merchant-initiated cancellations, a "Failed" delivery does not automatically refund. This needs to be handled manually by escalating to operations.

Q: Is there a minimum amount to fund a wallet?

A: Yes — ₦100 minimum via card/Paystack. No minimum is enforced on bank transfers to the virtual account, but very small transfers should still land normally.

15. Do Not Promise (Not Live Yet)

These come up in conversation but are **not actually available** to merchants/customers today. Don't confirm them as working features:

Live GPS tracking / rider-on-a-map / ETA countdown — not available to merchants or customers.

SMS notifications — not a supported channel at all.

Submitting a rider rating that actually counts for something — the feature is not functioning in production.

A formal dispute/complaint ticket you can look up by ID — doesn't exist; complaints are handled directly by support/ops, not tracked as a product object.

Automatic "no rider found" resolution — nothing resolves this automatically; it always needs a human dispatcher.

16. Glossary

Term	Plain meaning
Zone	A geographic area used to match riders to nearby orders.
Vertical	A larger business grouping made up of several zones, with its own lead overseeing performance.
Escrow	Money held by AXpress until a delivery is confirmed complete, then released.
Relay / Relay Node	For long-distance deliveries, the package can be handed off between two riders at a midpoint hub instead of one rider carrying it the whole way.
Virtual account	A personal bank account number issued to a merchant purely for topping up their wallet by transfer.
Overage fee	The flat fee charged per order once a subscription's free-order allowance is used up for the cycle.
Dedicated rider	A specific rider reserved for a merchant's orders, included with some subscription plans.
OCC / Operations Dashboard	Internal tools used by dispatchers and zone/vertical leads to monitor and manage the live fleet — not something merchants or customers see.
SmartParcel	A third-party parcel-locker service integrated into AXpress for locker-based drop-off/pickup, tracked separately from normal orders.

This guide reflects the product as of September 3, 2026. If something here conflicts with what you're seeing in a live tool, trust the live tool and flag the mismatch — this document is a reference, not a guarantee of current behavior.
